

Code Check-in/Pull requests

When checking in/merging code in the DevOps GIT environment, we have some standards by which those merges should happen.

Code should never be **pushed** to any of the primary branches (DEVL/DVLP, QUAL, UAT or PROD). A pull request must be done.

Development branch into DEVL/DVLP

- Requestor: Developer
- Approver (Code Review): 2nd Developer
- Marks Complete: Developer (if you wish to prune the branch, the person who created the branch will need to complete it otherwise the option will be disabled)
- Deployment: Automated by DevOps as soon as the pull request is complete

DVLP branch into QUAL

- Requestor: Developer
- Approver: Developer
- Marks Complete: Developer
- Deployment: Automated by DevOps as soon as the pull request is complete

QUAL branch into TEST(if exists)

- Requestor: Developer
- Approver: Developer
- Marks Complete: Developer
- Deployment: Manual (By web app ops) - Email request to Web App Ops, they will verify recent qualifying AppSec Scan(On QUAL) if required before push to TEST

QUAL branch into PROD

- Requestor: Developer
- Approver: Developer
- Marks Complete: Developer
- Deployment: Manual (By web app ops) - Service Desk request and needs to go through change management (same process that you have been doing for a while now)
